

Fulvic Acid

Fulvic – part of vegetable decomposition called Humic Acid

Many clinical trials and research done in Asia and Europe.

Considered a change agent for the environment

Properties:

- Free radical scavenger
 - Passes in to cells instantly
 - Supports organs
 - Millions of beneficial microbes
 - Detoxifying power
 - Helps in breakdown of proteins
 - Many nutrients
 - Helps with bioavailability of nutrients, enzymes
 - Immune system, heals infections and cuts
 - Helps absorption and assimilation of nutrients
 - Anti viral
 - Anti bacterial
 - Mineral co-factors
-
- Fulvic acid – is a powerful co-factor creating the ideal environment for mineral complexes and elements to bio-react electrically with our cells. Ionic molecules and elements become easily transported into and through cell membranes.
 - Fulvic acid essentially changes, regenerates, regulates and delivers living nutrient energies directly to living cells.
 - The fulvic material helps to chelate and carry away heavy metals and helps the body function more efficiently. Thus, fulvic provides a cleansing, detoxifying & delivery effect for nutrients.
 - The stabilized pre & probiotics further enhances the formulas by going beyond digestive distress & daily cleanse, helping to change the beneficial flora.
 - All activity of these materials help to chelate and bind exogenous material (heavy metals, foreign materials that cannot be metabolized and waste particles that can clog circulating pathways.) Thus, fulvic acid takes away stress in the body as it cleanses and enhances.
 - Dosage: ½ – 1 tablespoon in preferably one quart of water (as most people are dehydrated) provides a quick, easy, refreshing way to improve our body's milieu (cleaning and building).
